Docket No. AT9-99-287

**A METHOD AND APPARATUS FOR PERFORMING RASTER OPERATIONS IN
A DATA PROCESSING SYSTEM**

BACKGROUND OF THE INVENTION

5

1. Technical Field:

The present invention relates generally to an improved data processing system and, in particular, to an improved method and apparatus for processing graphics data. Still more particularly, the present invention relates to a method and apparatus for performing raster operations in a data processing system.

10

2. Description of Related Art:

As the monitors connected to computers become larger and faster the performance of the graphics subsystem must also be improved. It is not uncommon on PCs to find 19, 20 or 21 inch monitors capable of displaying images with 1200 x 1600 resolution (that is, 1200 scan lines vertically by 1600 picture elements, or pels, horizontally for each scan line) with refresh rates up to 85 Hz. The bitmap images manipulated by the processor are stored in main memory and must be transferred to the video memory on the graphics controller board. This transfer must be made as fast as possible.

20

25

At the heart of every graphical programming interface (GPI) is the concept of a raster operation (ROP). These raster operations are typically defined using 256 different combinations of logical operations performed on the source, pattern, and destination images to produce a new destination image. These operations are usually performed one picture element (pel) at a

30

00377642.00499

Docket No. AT9-99-287

time. Previously, performance problems have been identified with accessing video memory. Previous solutions have focused on reducing the number of instructions used to perform various graphic operations.

- 5 These and other prior solutions, however, do not recognize problems associated with data transfer across a bus. Performance problems associated with changing the direction of data transfer in raster operations have been previously unrecognized. The present invention has
- 10 recognized that when both source and destination images involved in the raster operation exist in video memory, severe performance problems can be experienced due to the overhead of repeatedly switching the input/output (I/O) bus from input to output and back. Therefore, it
- 15 would be advantageous to have an improved method and apparatus for performing raster operations.

Docket No. AT9-99-287

SUMMARY OF THE INVENTION

5 The present invention provides a method and apparatus in a data processing system for performing a raster operation of graphics data. A system memory and a video memory is included in the data processing system. The system memory and the video memory are connected by a bus wherein the graphics data is organized into picture elements. A plurality of picture elements is read from the system memory. A plurality of picture elements is read from the video memory. A raster operation is performed on the plurality of picture elements to form a plurality of processed picture elements. The plurality of processed picture elements is written to the video
10 memory.

Docket No. AT9-99-287

BRIEF DESCRIPTION OF THE DRAWINGS

The novel features believed characteristic of the invention are set forth in the appended claims. The invention itself, however, as well as a preferred mode of use, further objectives and advantages thereof, will best be understood by reference to the following detailed description of an illustrative embodiment when read in conjunction with the accompanying drawings, wherein:

Figure 1 is a pictorial representation depicting a data processing system in which the present invention may be implemented in accordance with a preferred embodiment of the present invention;

Figure 2 is a block diagram illustrating a data processing system in which the present invention may be implemented;

Figure 3 is a block diagram illustrating graphical subsystem layers and system resources used in processing raster operations depicted in accordance with a preferred embodiment of the present invention;

Figure 4 is a diagram illustrating common raster operations depicted in accordance with a preferred embodiment of the present invention;

Figure 5 is a flowchart of a known process for carrying out raster operations ;

Figure 6 is a flowchart of a process for performing a raster operation one scan line at a time, in which pels are written to video memory one scan line at a time, depicted in accordance with a preferred embodiment of the present invention; and

Figure 7 is a flowchart of a process for performing

Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged men. The subjects were divided into two groups: a control group (n = 10) and a training group (n = 10). The training group performed a 10-week program of aerobic exercise, consisting of 30 minutes of walking on a treadmill at 3.5 mph, 3 times per week. The control group did not exercise. HR and EE were measured at rest and during the exercise program. HR increased significantly in the training group during the exercise program, while EE increased significantly in the training group during the exercise program. The control group showed no significant changes in HR or EE. The results of this study suggest that a 10-week training program can improve HR and EE in sedentary, middle-aged men.

5

Docket No. AT9-99-287

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

With reference now to the figures and in particular with reference to **Figure 1**, a pictorial representation depicting a data processing system in which the present invention may be implemented in accordance with a preferred embodiment of the present invention. A personal computer 100 is depicted which includes a system unit 110, a video display terminal 102, a keyboard 104, storage devices 108, which may include floppy drives and other types of permanent and removable storage media, and mouse 106. Additional input devices may be included with personal computer 100. Personal computer 100 can be implemented using any suitable computer, such as an IBM Aptiva™ computer, a product of International Business Machines Corporation, located in Armonk, New York. Although the depicted representation shows a personal computer, other embodiment of the present invention may be implemented in other types of data processing systems, such as network computers, Web based television set top boxes, Internet appliances, etc. Computer 100 also preferably includes a graphical user interface that may be implemented by means of systems software residing in computer readable media in operation within computer 100.

With reference now to **Figure 2**, a block diagram illustrates a data processing system in which the present invention may be implemented. Data processing system 200 is an example of a computer, such as computer 100 in **Figure 1**, in which code or instructions implementing the processes of the present invention may be located. Data processing system 200 employs a peripheral component

Docket No. AT9-99-287

interconnect (PCI) local bus architecture. Although the depicted example employs a PCI bus, other bus architectures such as Micro Channel and Industry Standard Architecture (ISA) may be used. Processor 202 and main
5 memory 204 are connected to PCI local bus 206 through PCI bridge 208. PCI bridge 208 also may include an integrated memory controller and cache memory for processor 202.

Additional connections to PCI local bus 206 may be made through direct component interconnection or through
10 add-in boards. In the depicted example, local area network (LAN) adapter 210, small computer system interface SCSI host bus adapter 212, and expansion bus interface 214 are connected to PCI local bus 206 by direct component connection. In contrast, audio adapter 216, graphics
15 adapter 218, and audio/video adapter 219 are connected to PCI local bus 206 by add-in boards inserted into expansion slots. Expansion bus interface 214 provides a connection for a keyboard and mouse adapter 220, modem 222, and additional memory 224. SCSI host bus adapter 212 provides
20 a connection for hard disk drive 226, tape drive 228, and CD-ROM drive 230. Typical PCI local bus implementations will support three or four PCI expansion slots or add-in connectors.

An operating system runs on processor 202 and is used
25 to coordinate and provide control of various components within data processing system 200 in **Figure 2**. The operating system may be a commercially available operating system such as OS/2, which is available from International Business Machines Corporation. "OS/2" is a trademark of
30 International Business Machines Corporation. An object oriented programming system such as Java may run in

Docket No. AT9-99-287

conjunction with the operating system and provides calls to the operating system from Java programs or applications executing on data processing system 200. "Java" is a trademark of Sun Microsystems, Inc. Instructions for the operating system, the object-oriented operating system, and applications or programs are located on storage devices, such as hard disk drive 226, and may be loaded into main memory 204 for execution by processor 202.

Those of ordinary skill in the art will appreciate that the hardware in **Figure 2** may vary depending on the implementation. Other internal hardware or peripheral devices, such as flash ROM (or equivalent nonvolatile memory) or optical disk drives and the like, may be used in addition to or in place of the hardware depicted in **Figure 2**. Also, the processes of the present invention may be applied to a multiprocessor data processing system.

For example, data processing system 200, if optionally configured as a network computer, may not include SCSI host bus adapter 212, hard disk drive 226, tape drive 228, and CD-ROM 230, as noted by dotted line 232 in **Figure 2** denoting optional inclusion. In that case, the computer, to be properly called a client computer, must include some type of network communication interface, such as LAN adapter 210, modem 222, or the like. As another example, data processing system 200 may be a stand-alone system configured to be bootable without relying on some type of network communication interface, whether or not data processing system 200 comprises some type of network communication interface. As a further example, data processing system 200 may be a Personal

Docket No. AT9-99-287

Digital Assistant (PDA) device which is configured with ROM and/or flash ROM in order to provide non-volatile memory for storing operating system files and/or user-generated data.

5 The depicted example in **Figure 2** and above-described examples are not meant to imply architectural limitations. For example, data processing system **200** also may be a notebook computer or hand held computer in addition to taking the form of a PDA. Data processing
10 system **200** also may be a kiosk or a Web appliance.

 With reference now to **Figure 3**, a block diagram illustrating graphical subsystem layers and system resources used in processing raster operations is depicted in accordance with a preferred embodiment of the
15 present invention. In the depicted example, graphical subsystem **300** uses system resources **302** in performing raster operations. Graphical subsystem **300** contains a graphical user interface **304**, a graphics engine **306**, and a video driver **308**. System resources **302** contains system
20 memory **310**, video memory **312**, and video adapter **314**.

 Graphics engine **306** is a software subsystem layer within graphical subsystem **300**, which provides common graphical functions, which may process graphics data or send instructions for creating graphics images to
25 hardware via a video driver. Video driver **308** is software that provides an interface between video adapter **314** hardware and other programs, such as a graphics engine or an operating system. Video driver **308** provides adapter specific functions. If video driver **308** is unable to
30 perform a function, video driver **308** will call graphics engine **306** to perform the function. In other words,

Docket No. AT9-99-287

graphics engine 306 performs common functions without regard to the particular hardware while video driver 308 performs specific functions. In these examples, system memory 310 may be implemented using main memory 204 in **Figure 2**, while video memory 312 may be located within graphics adapter 218 in **Figure 2**. Video adapter 314 also may be implemented using graphics adapter 218 in **Figure 2**.

In this example, graphical user interface 304 is able to access system memory 310, but not video memory 312 or video adapter 314. Graphics engine 306 has an ability to access system memory 310 and video memory 312. Video driver 308 has the ability to access system memory 310, video memory 312, and video adapter 314. In particular, video driver 308 accesses a processor located on video adapter 314.

In previous systems, graphics engine 306 would obtain a pel from system memory 310 and a pel from video memory 312. This information is stored in a register and a logical OR function is performed on the pel with the result then being returned to video memory 312. As can be seen, a read and a write operation is required for each pel that is processed. This read and write operation for each pel results in the direction of data transfer on the bus to the video memory being changed twice for each pel that is processed. Such a repeated change in direction of data transfer results in performance degradation in graphics processing, which was previously unrecognized by the prior art. The present invention recognizes that performance degradation occurs with changing the direction of data transfer for each pel

Docket No. AT9-99-287

when performing graphics processing, such as raster operations.

To understand this problem, it is helpful to examine some particular cases. When raster operation is performed updating the video memory without regard to the current state of the video memory, then no performance problems occur. This situation is present because the I/O bus connecting the video memory to the system is always sending data in one direction. The raster operation "src -> dst" is an example of a single direction data transfer. With this raster operation, each pel is read from the source bitmap (src) in system memory and written to the corresponding pel in the destination bitmap (dst) in video memory. The transfer of data is strictly unidirectional from the system memory to the video memory.

However, if the raster operation is "src OR dst -> dst", each pel written to the destination bitmap in video memory is constructed by performing a logical OR operation on pels read from both the source bitmap in system memory and the destination bitmap in video memory.

In existing systems, this operation is performed one pel at a time. This type of operation incurs a bus turnaround delay twice for every pel. In other words, the current value of the pel in the video memory must be sent to the processor (input direction) and ORed with the current value in system memory. This resultant value is then sent from the system memory to the video memory (output direction). A delay is involved every time the I/O bus has to change direction and this occurs twice per pel. In these circumstances, significant performance degradation is present.

Docket No. AT9-99-287

5 The present invention solves this problem by
providing a method, apparatus, and instructions for
faster raster operations. The processes of the present
invention may be applied to a raster, which is a regular
pattern of lines. On a video display, the raster
operations are performed in which the number of changes
in the direction in which data transfer occurs is
minimized. Raster operations are methods of generating
graphics that treat an image as a collection of small
10 independently controlled dots, such as pixels or picture
elements, which may be arranged in rows and columns.
This increased performance is provided by a mechanism in
which a block of pels, such as, for example, a scan line,
is read from video memory 312 into a buffer in system
15 memory 310. Another scan line is placed into a buffer in
system memory 310. At this time, a logical OR operation
is performed. This operation may be a pel at the time
with each pel being returned to video memory 312 as the
logical OR operation is performed.

20 Alternatively, an entire block of information may be
logically ORed prior to returning the information to
video memory 312. This transfer of data may be made
using, for example, a bit block transfer, which is a
mechanism to manipulate blocks of bits and memory that
25 represent color and other attributes of a rectangular
block of pixels forming a screen image. In this manner,
successive changes in the direction of data flow on the
bus are not required for each pel. Instead, the change
in direction may be made for a group of pels, such as a
30 scan line.

In the depicted examples, the processes are

Docket No. AT9-99-287

illustrated as being located within graphics engine **306**, since graphics accelerations would be controlled by the video driver.

With reference now to **Figure 4**, a diagram of common raster operations is depicted in accordance with a preferred embodiment of the present invention. These raster operations in table **400** are examples of operations that may be performed by graphics engine **306**. For simplicity, this table contains only those raster operations involving only source and destination images. Raster operations are typically defined as 256 different combinations of logical operations performed on the source, pattern, and destination images to produce a new destination image. Table **400** in **Figure 4** illustrates a partial list of these operations. Operations requiring knowledge of the current contents of the video memory to calculate the bit map for the next screen is of particular interest with respect to performance. For example, operation OR is an operation in which each pel from a source is logically ORred with a pel from a destination with the result being written to a destination bit map in video memory. The pels constructed by performing a logical OR operation on pels read from both the source bit map in system memory and the destination bit map in video memory. This transfer is an example of a transfer of information that requires a read and write on the I/O bus.

With reference now to **Figure 5**, a flowchart of a known process for carrying out raster operations is illustrated. This known process begins by reading a pel from system memory (step **500**). This pel is part of a

Docket No. AT9-99-287

source bit map located in the system memory. Thereafter, a single pel is read from video memory (step 502). This pel is part of a destination bit map located in the video memory. This step requires a read from the bus. These
 5 pels are typically stored in a register. Thereafter, a raster operation is performed on the pels (step 504).

Next, the pel is written to the video memory (step 506). This step requires a write across the bus to the video memory. Thereafter, a determination is made as to
 10 whether more pels are on the line for processing (step 508). If additional pels are present, the process then returns to step 500. Otherwise, a determination is made as to whether more lines are present in the bit map that is being processed by the raster operation (step 510).

15 If more lines are present in the bit map, the process then returns to step 500 to process the next line one pel at a time. Otherwise, the process terminates. As can be seen in the process illustrated in **Figure 5**, a change in direction of data on the data bus is required for each
 20 pel that is transferred. As a result, a turn around delay is incurred two times for each pel.

With reference now to **Figure 6**, a flowchart of a process for performing a raster operation is depicted in accordance with a preferred embodiment of the present
 25 invention. In this example, the processes of the present invention processes pels one scan line at a time.

In the depicted example, the process begins by reading a line from system memory (step 600). In the depicted example, this line is a scan line, which is read
 30 into a buffer in system memory. In this example, the scan line is part of a source bit map located on the

03764-039265

Docket No. AT9-99-287

system memory. Of course, other blocks of pels may be read from system memory depending on the implementation. Next, one line is read from video memory (step 602). This line is a scan line that is part of a destination
5 bit map in the video memory associated with the video adapter. This particular step requires a transfer across the bus. Thereafter, a raster operation is performed on all of the pels in the line (step 604). In the depicted example, this raster operation may be a logical OR. This
10 operation is performed on data stored within the system memory. Thereafter, the line is written to the video memory (step 606). This step requires a transfer in the opposite direction across the bus. Thereafter, a determination is made as to whether more scan lines are
15 present in the bit map for processing. If additional scan lines are present, the process returns (step 600) to read a line from the system memory. Otherwise, the process terminates. As can be seen, this process reduces the number of bus delays by batching the accesses to the
20 video memory as compared to the process illustrated in **Figure 5**.

With reference now to **Figure 7**, a flowchart of a process for performing raster operations is depicted in accordance with a preferred embodiment of the present
25 invention. In **Figure 7**, the processes illustrated reduce the number of changes in direction in the bus even though pels are individually written back to the video memory after being processed. **Figure 7** shows a process in which the writing of pels to video memory can be performed one
30 pel at a time without performance degradation as long as reads are not interleaved with writes.

Docket No. AT9-99-287

5 The process begins by reading one line from system
memory (step 700). Thereafter, one line is read from
video memory (step 702). Thereafter, a raster operation
is performed on one pel (step 704). Thereafter, the
resulting pel is written to video memory (step 706). A
determination is then made as to whether more pels are
present in the line (step 708). If more pels are
present, then the next unprocessed pel is selected for
processing (step 710), with the process then returning to
10 step 704 as described above. Otherwise, a determination
is made as to whether more lines are present in the bit
map (step 712). If more lines are present, then the next
unprocessed line is selected for processing (step 714),
with the process then returning to step 700 to read that
15 line from system memory. If additional lines are not
present in the bit map for processing, the process then
terminates. In this particular example, the raster
operations are performed one pel at a time with each pel
then being written back to the video memory. Performance
20 hits, however, resulting from reads and writes are not
incurred here as with the presently known processes.
This lack of performance degradation occurs because an
entire line of pels are written from the video memory
over to the system memory for processing. The pels are
25 then written back to the video memory one at a time, but
a change in direction is not required for each raster
operation.

Therefore, the present invention provides an
improved method, apparatus, and instructions for
30 performing raster operations, which avoid the severe
performance problems experienced with the overhead of

Docket No. AT9-99-287

repeatedly switching the video bus from input to output and back. The present invention provides this advantage through video accesses being grouped into batches of entirely input or entirely output operations. As a
5 result, the number of delays encountered by waiting for the bus to change directions is minimized. By batching the input and output on each line, video performance may be doubled. Although the example in **Figure 7** shows the batching of reads, the same mechanism may be performed
10 for the batching of writes.

It is important to note that while the present invention has been described in the context of a fully functioning data processing system, those of ordinary skill in the art will appreciate that the processes of
15 the present invention are capable of being distributed in the form of a computer readable medium of instructions and a variety of forms and that the present invention applies equally regardless of the particular type of signal bearing media actually used to carry out the
20 distribution. Examples of computer readable media include recordable-type media such a floppy disc, a hard disk drive, a RAM, and CD-ROMs and transmission-type media such as digital and analog communications links.

The description of the present invention has been
25 presented for purposes of illustration and description, but is not intended to be exhaustive or limited to the invention in the form disclosed. Many modifications and variations will be apparent to those of ordinary skill in the art. For example, although the depicted examples
30 illustrate the processes being embodied within a graphics engine in a graphical subsystem, these process may be implemented in other locations in the operating system.

556480 "44947250

Docket No. AT9-99-287

For example, the processes also may be implemented within a device driver, such as video driver 308 in **Figure 3**.

5 The embodiment was chosen and described in order to best explain the principles of the invention, the practical application, and to enable others of ordinary skill in the art to understand the invention for various embodiment with various modifications as are suited to the particular use contemplated.

656789 0123456789

Docket No. AT9-99-287

CLAIMS:

What is claimed is:

1. A method in a data processing system for performing
5 a raster operation of graphics data, wherein the data
processing system includes a system memory and a video
memory, wherein the system memory and the video memory
are connected by a bus and wherein the graphics data is
organized into picture elements, the method comprising
10 the data processing system implemented steps of:
 reading a first plurality of picture elements from
the system memory;
 reading a second plurality of picture elements from
the video memory;
15 performing a raster operation on the first plurality
of picture elements and the second plurality of picture
elements to form a plurality of processed picture
elements; and
 writing the plurality of processed picture elements
20 to the video memory such that the direction of data on
the bus is unchanged between the reading and writing of
picture elements.
2. The method of claim 1, wherein the plurality of
25 processed picture elements form a scan line.
3. The method of claim 1, wherein the raster operation
performs any logical function using a picture element
from the system memory and a picture element from the
30 video memory.
4. The method of claim 1, wherein the first plurality

666T30" 24942660

Docket No. AT9-99-287

of picture elements are part of a source bitmap.

5. The method of claim 1, wherein the second plurality of picture elements are part of a destination bitmap.

5

6. The method of claim 1, wherein the reading steps, the performing step, and the writing step are performed in a graphics engine.

10 7. A method for performing raster operations in a graphics system, wherein the method comprises the data processing system implemented steps of:
collecting a set of input operations into a batch of input operations substantially equal to a number of
15 rasters in a video display; and
sending the set of input operations on a video bus in a single operation.

20 8. The method of claim 7 further comprising:
collecting a set of output operations into a batch of output operations substantially equal to a number of rasters in a video display; and
sending the set of output operations on a video bus
25 in a single operation.

9. The method of claim 7, wherein the set of input operations are sent to a system memory connected to a video bus.

30

10. The method of claim 7, wherein the set of output operations are sent to a video memory connected to a

654747-0199

Docket No. AT9-99-287

video bus.

11. A method for performing raster operations in a graphics system, wherein the method comprises the data processing system implemented steps of:
- collecting a set of output operations into a batch of input operations substantially equal to a number of rasters in a video display; and
 - sending the set of output operations on a video bus in a single operation.
12. A data processing system comprising:
- a bus;
 - a system memory connected the bus, wherein a first plurality of graphics elements are located within the system memory;
 - a video memory connected to the bus, wherein a second plurality of graphics elements are located within the video memory;
 - a processor unit connected to the bus, wherein the processor unit executes instructions for an operating system, wherein the operating system reads the second plurality of graphics elements within the video memory into the system memory, performs a raster operation on the second plurality of graphics elements within the video memory with the second plurality of graphics elements within the system memory to form a plurality of processed graphics elements, and writes the plurality of processed graphics elements into the video memory,
 - wherein the first plurality and the second plurality form a set of pluralities and between the first plurality and the second plurality, at least one of the pluralities is

Docket No. AT9-99-287

transferred in a single operation.

13. The data processing system of claim 12, wherein the
first plurality of graphics elements is a plurality of
5 picture elements.

14. The data processing system of claim 12, wherein the
first plurality of graphics elements form a scan line.

10 15. The data processing system of claim 12, wherein the
scan line is a scan line in a bitmap.

16. The data processing system of claim 13, wherein the
first plurality of picture elements form a bitmap.

15 17. The data processing system of claim 12, wherein a
graphics engine in the operating system performs the
raster operation.

20 18. The data processing system of claim 12, wherein a
video driver in the operating system performs the raster
operation.

19. A data processing system for performing a raster
25 operation of graphics data, wherein the data processing
system includes a system memory and a video memory,
wherein the system memory and the video memory are
connected by a bus and wherein the graphics data is
organized into picture elements, the data processing
30 system comprising:

first reading means for reading a first plurality of
picture elements from the system memory;

second reading means for reading a second plurality of picture elements from the video memory;

writing means for writing the plurality of processed picture elements to the video memory such that the direction of data on the bus is unchanged between the reading and writing of picture elements.

15 21. The data processing system of claim 19, wherein the raster operation performs any logical function using a picture element from the system memory and a picture element from the video memory.

23. The data processing system of claim 19, wherein the second plurality of picture elements are part of a destination bitmap.

24. The data processing system of claim 19, wherein the first reading means, the second reading means, the performing means, and the writing means are located in a graphics engine in the data processing system.

Docket No. AT9-99-287

25. A data processing system for performing raster operations in a graphics system, wherein the data processing system comprises:

5 collecting means for collecting a set of input operations into a batch of input operations substantially equal to a number of rasters in a video display; and

 sending means for sending the set of input operations on a video bus in a single operation.

10 26. The data processing system of claim 25 further comprising:

 collecting means for collecting a set of output operations into a batch of output operations substantially equal to a number of rasters in a video display; and

15 sending means for sending the set of output operations on a video bus in a single operation.

20 27. The data processing system of claim 25, wherein the set of input operations are sent to a system memory connected to a video bus.

25 28. The data processing system of claim 25, wherein the set of output operations are sent to a video memory connected to a video bus.

29. A data processing system for performing raster operations in a graphics system, wherein the data processing system comprises:

30 collecting means for collecting a set of output operations into a batch of input operations substantially equal to a number of rasters in a video display; and

sending means for sending the set of output operations on a video bus in a single operation.

30. A computer program product in a computer readable
5 medium for performing a raster operation of graphics data, wherein the data processing system includes a system memory and a video memory, wherein the system memory and the video memory are connected by a bus and wherein the graphics data is organized into picture
10 elements, the computer program product comprising:

first instructions for reading a first plurality of picture elements from the system memory;

second instructions for reading a second plurality of picture elements from the video memory;

15 third instructions for performing a raster operation on the first plurality of picture elements and the second plurality of picture elements to form a plurality of processed picture elements; and

fourth instructions for writing the plurality of
20 processed picture elements to the video memory.

31. A computer program product in a computer readable medium for performing raster operations in a graphics system, wherein the computer program product comprises:

25 first instructions for collecting a set of input operations into a batch of input operations substantially equal to a number of rasters in a video display; and

second instructions for sending the set of input operations on a video bus in a single operation.

30 32. A computer program product in a computer readable medium for performing raster operations in a graphics

Docket No. AT9-99-287

system, wherein the computer program product comprises:

first instructions for collecting a set of output operations into a batch of input operations substantially equal to a number of rasters in a video display; and

5 second instructions for sending the set of output operations on a video bus in a single operation.

Docket No. AT9-99-287

ABSTRACT OF THE DISCLOSURE

A METHOD AND APPARATUS FOR PERFORMING RASTER OPERATIONS IN A DATA PROCESSING SYSTEM

A method and apparatus in a data processing system for performing a raster operation of graphics data. A system memory and a video memory is included in the data processing system. The system memory and the video memory are connected by a bus wherein the graphics data is organized into picture elements. A plurality of picture elements is read from the system memory. A plurality of picture elements is read from the video memory. A raster operation is performed on the plurality of picture elements to form a plurality of processed picture elements. The plurality of processed picture elements is written to the video memory.

DECLARATION AND POWER OF ATTORNEY FOR
PATENT APPLICATION

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name;

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled A METHOD AND APPARATUS FOR PERFORMING RASTER OPERATIONS IN A DATA PROCESSING SYSTEM

the specification of which (check one)

X is attached hereto.

___ was filed on _____
as Application Serial No. _____
and was amended on _____
(if applicable)

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to the patentability of this application in accordance with Title 37, Code of Federal Regulations, §1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, §119 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

Prior Foreign Application(s):			Priority Claimed
_____ (Number)	_____ (Country)	_____ (Day/Month/Year)	___ Yes___ No

I hereby claim the benefit under Title 35, United States Code, §120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, §112, I acknowledge the duty to disclose information material to the patentability of this application as defined in Title 37, Code of Federal Regulations, §1.56 which occurred between the filing date of the prior application and the national or PCT international filing date of this application:

_____ (Application Serial #)	_____ (Filing Date)	_____ (Status)
---------------------------------	------------------------	-------------------

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

POWER OF ATTORNEY: As a named inventor, I hereby appoint the following attorneys and/or agents to prosecute this application and transact all business in the Patent and Trademark Office connected therewith.

John W. Henderson, Jr., Reg. No. 26,907; Thomas E. Tyson, Reg. No. 28,543; James H. Barksdale, Jr., Reg. No. 24,091; Casimer K. Salys, Reg. No. 28,900; Robert M. Carwell, Reg. No. 28,499; Douglas H. Lefevre, Reg. No. 26,193; Jeffrey S. LaBaw, Reg. No. 31,633; David A. Mims, Jr., Reg. 32,708; Volel Emile, Reg. No. 39,969; Anthony V. England, Reg. No. 35,129; Leslie A. Van Leeuwen, Reg. No. 42,196; Christopher A. Hughes, Reg. No. 26,914; Edward A. Pennington, Reg. No. 32,588; John E. Hoel, Reg. No. 26,279; Joseph C. Redmond, Jr., Reg. No. 18,753; Marilyn S. Dawkins, Reg. No. 31,140; Duke W. Yee, Reg. No. 34,285; Mark E. McBurney, Reg. No. 33,114; and Colin P. Cahoon, Reg. No. 38,836; Joseph R. Burwell, Reg. No. 44,468; Rudolph J. Buchel, Reg. No. 43,448; Stephen R. Loe, Reg. No. 43,757.

Send correspondence to: Duke W. Yee, Carstens, Yee & Cahoon, LLP, P.O. Box 802334, Dallas, Texas 75380 and direct all telephone calls to Duke W. Yee, (972) 362-2001
